GTHA FARE INTEGRATION

Leslie Woo
Chief Planning Officer

Metrolinx Board of Directors Meeting
February 10, 2016
Progress Update

• The September board report on Regional Fare Policy presented various fare structures and identified those for further study.

• Analysis of GTHA transit ridership and review of best practices has resulted in five design principles that inform fare structure development.

• This report presents three ‘fare structure concepts’, reflecting those principles, to be further refined and evaluated.

• There has been active municipal transit agency involvement in the development of these fare structure concepts.

• Initial recommendations on GTHA Fare Integration will be reported at the June 2016 Board meeting.

Staff are seeking the Board’s input on the three fare structure concepts for consultation and evaluation.
Step 1. What type(s) of fare structure best meet vision/goal/objectives?

Step 2. What is the best way of applying such type(s) of fare structure to the GTHA?

Step 3. Should other fare structure elements be included?

Step 4. How do we implement this structure?

- Type of Service
  - Trip Length

- Service categories
  - Zone size and design
  - Price structure
  - Transfer policies

- Time of day fares
  - Additional fare structure optimization/calibration

- Revenue allocation
  - Fiscal impact
  - Phasing
  - Governance
Recap: Step 1 Summary Findings

- Uniform fares for all service types do not reflect the value of service to the customer and were removed from further consideration
- Travel Time based fares are variable and unpredictable and are not being investigated further
- Region-wide flat fares do not reflect value of longer trips and are being considered for Local services only
- Measured distance-based fares for Local services are complex to apply and have marginal benefits
- Zone-based and Hybrid fare structure types were retained for more detailed investigation

### Consideration of Trip Length

<table>
<thead>
<tr>
<th>Consideration of Service Type</th>

## Defining Service Types

- 3 Service Types (Local, Rapid Transit, Regional) were defined using parameters that reflect qualities that customers value in transit services (i.e. speed and travel time consistency)

<table>
<thead>
<tr>
<th>Service Type</th>
<th>Examples</th>
<th>Stop spacing</th>
<th>Route Length</th>
<th>Average speed</th>
<th>Right of way</th>
</tr>
</thead>
</table>
| **Local Transit** | • Conventional Bus  
• Streetcar                               | <750 m       | <20 km       | Low 10-20 km/h  | • Generally in mixed traffic; some sections of separation |
| **Rapid Transit** | • Light Rail Transit (LRT)  
• Subway                               | 500 m – 2.5 km | <25 km       | Medium 20-45 km/h | • >90% Separate                                   |
| **Regional Transit** | • GO Train  
• Highway coach                           | >2 km         | >20 km       | High >45 km/h   | • Separate (rail)  
• In mixed traffic (highway bus)                   |

Note: Specialized service types such as express bus, rural services, and UP Express will be considered later in the evaluation.
Service Types: Relation to Markets

• Service types serve different markets as revealed by data on demand by trip distance

Markets
1. Short distance, served by
   • Local and Rapid Transit
2. Medium distance, served by
   • Rapid Transit, often with Local feeder
   • Local when Rapid Transit is not available
   • Regional (Future RER/SmartTrack)
3. Long distance served by
   • Regional (Future RER/SmartTrack)
Principle: Continuity

• Customers may use different service types for the same length trips due to service availability

• For customer convenience and efficient use of the available network, fares for different service types should be comparable when the services serve the same market

Trip distance: Short    Medium    Long

Local and Rapid Transit fares should be comparable for short trips

Rapid Transit and Regional (RER) fares should be comparable for medium trips
Principle: Connected Network

- The GTHA transit network design often requires customers to use multiple service types to complete trips.
- To provide integrated use of the network, fares should not penalise trips that require the use of multiple service types.

![Diagram showing different types of transfers and trip distances]
**Principle: Generalized Cost**

- Service types travel at different speeds and take different times to travel the same distance

- Passengers travelling on slower service modes ‘pay’ more in time than on faster service modes

- Where there is a significant difference in travel time, fares should be lower for slower service types than for faster service types

*Example: Bloor to Sheppard is 19 minutes by subway and 40 minutes by bus*
Principle: Gradual Increments

- Large jumps in fare encourage customers to reroute their travel to obtain the lower fare.

- To encourage customers to use the service that best meets their travel needs, fares that vary by distance should escalate consistently or in small increments and avoid large jumps.
Principle: Large/Small Zones

Large zones
- Typically designed with most short trips 1 or 2 zones long
- Customers generally know their fares in advance without needing to consult a map or table
- Can be implemented on Local Transit with on-board fare payment and enforcement

Small zones
- Usually require tap on/off fare collection to determine trip length
- More suitable for Rapid Transit and Regional Transit

Both large and small zones are widely used throughout the world
Fare by Distance Approaches

- Fares may vary by distance differently for each service type
- Three overall fare by distance approaches have been considered:

<table>
<thead>
<tr>
<th>Fare by distance type</th>
<th>Description</th>
<th>Applicable Service Types</th>
</tr>
</thead>
</table>
| Region-Wide Flat Fare    | • A single flat fare is used for all Local                   
                             • Transfers may be directional and/or time based  
                             (example: 2 hour transfer window for all Local services) | Local                             |
| Geographic Zones         | • Zones are drawn across the GTHA                              
                             • Fare increases based on number of zones passed through | Local, Rapid Transit, Regional    |
| Measured Distance        | • Fares are set based on distance travelled                     
                             • Communicate to customers as ‘station to station’ fare        | Rapid Transit, Regional Transit   |
Fare Structure Design Logic

- Fare structures selected for each service type must work logically together.
- Fare structure concepts were built by Service Type, beginning with Local as it has the most trips.

1. Local
2. Rapid Transit
3. Regional

- Local can have region-wide flat fares or zones (from Step 1).
Existing Fare Structure: ‘Status Quo’

**Local**: each Municipal Service Provider sets their own fares; mostly flat with zones for some long trips*

**Rapid Transit**: same as Local

**Regional**: small zones, with a flat fare for short to medium length trips

**Transfers**: free between 905 operators, double fare between 905 and Toronto*, co-fare between 905 and GO, double fare between Toronto and GO*
Concept 1: Modified Status Quo

Design Rationale: modify current fare environment to address the most significant issues with the status quo.

Features
- Consistent transfer policy between municipal transit agencies (may require additional fare*)
- Consistent transfer policy between municipal transit and GO
- Regional base fare and Rapid Transit fares more closely aligned to improve continuity for medium length trips

* Local
Rapid Transit
Regional
Examples: Modified Status Quo

Joe used to take the subway to his job downtown even though the GO station is nearby and the GO Train is faster. Now GO fares are closer to subway fares for the same trip, and Joe uses GO when it meets his travel needs.

Jane used to take MiWay from her home and pay a second fare when she transferred to TTC to get to school. Now she pays a discounted transfer fare when she enters the TTC.

Mary used to drive her car to the GO Train at Agincourt when she went downtown. Now she uses the TTC to get to the GO Station and receives a co-fare transfer discount when she taps on the GO.
Concept 2: Local and Rapid Transit Zones

**Design Rationale:** develop a new regional fare structure with fare by zone for Local and Rapid Transit, adding flexibility to pricing

**Features**

- Local and Rapid Transit use large zones, aligned for simplicity, but may have different fares
- Regional fares for medium distance trips are comparable to Rapid Transit
- Transfer policy required for transfers between service types

![Diagram showing fare structure by distance for Local, Rapid Transit, and Regional zones.](image-url)
Example: Local and Rapid Transit Zones

Emma takes Durham Region Transit from her home in Ajax and transfers onto the TTC to visit her daughter. She used to pay a second fare when she boarded the TTC bus. Now she pays the fare for 3 zones when she starts her trip.
Concept 3: Hybrid

**Design Rationale:** develop a new fare structure with region-wide flat fare for Local with Rapid Transit and Regional using small zones or fare by distance

**Features**

- Region-wide flat Local fare
- Rapid Transit comparable to Local for short trips
- Regional fares comparable to Rapid Transit for medium distance trips
- Transfer policy required for transfers between service types

![Graph showing fare structure](image)

- Red: Local
- Blue: Rapid Transit
- Green: Regional

<table>
<thead>
<tr>
<th>Distance</th>
<th>$ Fare</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short</td>
<td>Low</td>
</tr>
<tr>
<td>Medium</td>
<td></td>
</tr>
<tr>
<td>Long</td>
<td></td>
</tr>
</tbody>
</table>
Example: Hybrid

Amir takes York Region Transit from his home and transfers to the TTC subway to get to his appointments. He used to pay a second fare when he boarded the TTC. Now, he pays the flat fare when boarding the bus, and taps on and off when he boards and leaves the subway. Because his trip on the subway is longer than a certain threshold, when he taps off an additional fare reflecting this distance is deducted from his PRESTO card.

Chris uses several municipal buses from her home in Oakville to reach a client in northwest Toronto. She used to pay a second fare when she boarded the TTC bus. Now, she pays a single flat fare for the entire trip when she boards the first bus.
Evaluation Framework

Simplicity
- Travellers perceive one GTHA transit network, multiple agencies
- Easy to understand
- Suitable for different trip and traveller types
- Adaptable to changes in service, operations, and infrastructure
- Practical to implement, manage and revise over its lifecycle
- User friendly point of purchase experience

Value
- Reflects value of service received
- Supports transit ridership growth
- Promotes social equity
- Provides value for money on transit investments and costs
- Generates revenue in support of cost recovery plans
- Minimizes fare underpayment
- Supports economic growth and environmental sustainability

Consistency
- Offers common fare concessions and products
- Provides easy fare payment for trips involving multiple services or modes
- Allows service providers to adapt to meet changing customer needs
- Distributes demand efficiently throughout the network
- Facilitates standardized fare management
A fare integration stakeholder engagement plan will include a range of activities intended to inform, consult, involve and collaborate with municipal partners, elected officials, community groups and the general public.

February – March 2016
- Municipal Partner Meetings
- Regional Open Houses
- Digital Engagement

April 2016
- Community Groups
- Public Meetings
- Digital Engagement
Next steps

January-April 2016: Consultation on concepts as input to evaluation

January-May 2016: Concept Analysis and Evaluation

- Refinement of concepts (Impacts of different zone sizes, transfer policies, pricing structures)
- Evaluation of concepts using objective-driven framework

June 2016: Report findings and preferred fare structure

Summer/Fall 2016: Assess additional fare structure elements and implementation considerations
APPENDICES
Recap: A Customer-First Vision

Vision Statement

- The GTHA Regional Fare Integration Strategy will increase customer mobility and transit ridership while maintaining the financial sustainability of GTHA’s transit services
- This strategy will remove barriers and enable transit to be perceived and experienced as one network composed of multiple systems/service providers

Goal 1: Simplicity

- The fare strategy will simplify customer experience and agency fare management/operations, attracting travellers to transit services throughout the GTHA

Goal 2: Value

- The fare strategy will reflect the value of the trip taken, and maintain the financial sustainability of transit services

Goal 3: Consistency

- The fare strategy will create a common fare structure with consistent definitions and rules across the GTHA
## Recap: Elements of Fare Integration

The elements of fare integration contribute to an easy fare payment experience.

<table>
<thead>
<tr>
<th>Element</th>
<th>What it is</th>
<th>Customer Expectation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payment System</td>
<td>System for fare collection: Farecard, mobile device, credit card, etc</td>
<td>One method to pay anywhere</td>

</table>
## Fare Strategy Objectives (1/3): Customer Perspective

The fare strategy objectives, developed with the municipal transit service providers, reflect customer, service provider and regional policy perspectives, and provide the basis for evaluating the fare structure alternatives.

<table>
<thead>
<tr>
<th>Category</th>
<th>Label</th>
<th>Objective</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simplicity</td>
<td>C1</td>
<td>Enables travellers to perceive the GTHA’s various transit options as one network</td>

<td>Supports future service developments</td>
</tr>
</tbody>
</table>
Evaluation Tools

• To assess all concepts against the 27 objectives, four analysis approaches will be applied
• These four tools will be used to generate evidence for all 27 objectives included in the business case framework (strategic, financial, economic, deliverability)

<table>
<thead>
<tr>
<th>Analysis Approach</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Barrier Analysis</td>
<td>Assessment of how the structure removes fare barriers (cost, complexity, captivity) including assessment of changes to fares for each market/sub market, representative origins and destinations, and trip lengths</td>
</tr>
<tr>
<td>Customer/Structure Interaction</td>
<td>Assess how customers interact with the structure at various stages of different trip types.</td>
</tr>
</tbody>
</table>
| Modelling                                      | Use of ridership response model to estimate for the region and market:  
  • Change in ridership and demand distribution throughout network  
  • Change in revenue  
  • Change in Vehicle Kilometers Traveled (VKT)  
  • Equity assessment |
| Implementation, Maintenance, and Adaptability  | Assessment of implementation impacts including fare collection requirements (tap on/tap off, enforcement), costs (capital/op/life cycle costs) and benefits (data and planning) |
