

Headwall Construction Scarborough Subway Extension

July 2022

What is happening?

Tunnelling work for the Scarborough Subway Extension is now underway. A crucial part of the tunnel building process is the installation of headwalls. These headwalls are underground support structures that create the frame for future subway stations and emergency exit buildings. The tunnel boring machine will pass through these headwalls.

Where is this happening?

Headwalls will be built along the new subway route from Sheppard Avenue East and McCowan Road to Kennedy Station. Two headwalls need to be built for the future subway station at Lawrence Avenue and McCowan Road, as shown on the map.

When is this happening and how long will it take?

Work to build the headwall at this location is expected to start in August 2022 and will last until March 2023.

What kind of construction activities will take place?

Small construction teams will be working at these sites during daytime hours. Surface level activities will involve setting up the two sites, installing temporary equipment, relocating some utilities and drilling concrete piles underground to build the headwalls.

Noise

Noise and vibration from construction work are expected. During construction, every effort will be made to mitigate impacts as a result of noise. Noise will be monitored and the appropriate mitigation measure will be applied. The equipment that is used on-site will also include sound absorber pads to dampen noise.

Safety

To ensure pedestrians and drivers remain safe, especially when large equipment is being used near the construction sites, construction crews will temporarily relocate nearby bus stops and close traffic lanes and sidewalks along McCowan Road. Signage will be in place to alert drivers and pedestrians regarding these temporary closures.

Project Background

The Scarborough Subway Extension will create three new stops at Lawrence and McCowan, Scarborough Centre and Sheppard and McCowan. The extension will replace the existing Line 3 (the Scarborough RT) and is estimated to be complete by 2029-30.
